

Note for visitors to this website:

If you are using Safari, Google, or Google Chrome as a browser, you might notice that Google has started adding to any organizational website which does not use SSL, an expensive security feature, a "not secure" note in these organizations website address lines. They have tried to force every organization to go to SSL according to the folks who host our site. (Firefox and Yahoo search engines does not do this).

But because our site does not sell, use email, or advertise, and because we are an informational and organizational website only, *our site is very secure*.

Here is an example of another strictly organizational website that comes up "not secure." It is a historical website that gives information about the early Baptist history in Wales. If you click on the site (below) it will also come up in your address line as "not secure," which we know, of course, is not true; it is a very secure website:
